

Supplementary Figure 1 | Single-channel conductance of NaK after reconstitution into lipid bilayers at various membrane potentials. Currents were recorded with 15 mM NaCl , $150 \mathrm{mM} \mathrm{KCl}, 5 \mathrm{mM}$ Mops, 5 mM Tris- $\mathrm{HCl}, \mathrm{pH} 7.0$ in the cis-chamber and $150 \mathrm{mM} \mathrm{NaCl}, 15$ $\mathrm{mM} \mathrm{KCl}, 5 \mathrm{mM}$ Mops, 5 mM Tris- $\mathrm{HCl}, \mathrm{pH} 7.0$ in the trans-chamber. Solid line: closed (C); dashed line: open (O).

Supplementary Figure $2 \mid$ Sequential 'backbone walk' using the recorded 3D spectra for A53 to S57. Contours from the NCACO spectrum (purple), the NCACB spectrum with positive CA signals (magenta) and negative CB signals (green), the NCOCA spectrum (light blue), the NCOCACB spectrum with negative CB signals only (orange), and the CONCA spectrum (red) are shown. Dashed lines connect signals in different spectra that exhibit the same chemical shift. All spectra were recorded on a sample of uniformly $\left[{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}\right]$-labeled NaK in the presence of 50 mM Na . The experiments were conducted on a 16.4 T wide-bore NMR spectrometer at 17 kHz MAS rate.

Supplementary Figure $3 \mid 2 D^{13} \mathrm{C}-{ }^{13} \mathrm{C}$ PDSD correlation spectrum of uniformly $\left[{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}\right]$ labeled $\mathbf{N a K}$ in the presence of $\mathbf{5 0} \mathbf{~ m M ~ N a}{ }^{+}$. The spectrum was recorded on a 16.4 T widebore NMR spectrometer at 11 kHz MAS rate. The ${ }^{13} \mathrm{C}^{-13} \mathrm{C}$ mixing time was set to 20 ms .

Supplementary Figure $4 \mid$ Scalar based HC spectrum of uniformly $\left[{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}\right]$-labeled NaK in the presence of $\mathbf{5 0} \mathbf{~ m M ~ N a}$. The observed spin systems correlate well to the Cterminal residue types ( ${ }_{105} \mathrm{PSILSNRKKE}_{114}$ ) following the M2 helix and the N -terminal alanine residue.

Supplementary Figure 5 | Excerpts of the V64 cross-peaks from PDSD spectra. Close-up of the CA-CB cross-peaks of V64. Spectra are presented in grey for sample A ( $<1 \mu \mathrm{M}$ ions), in blue for sample B (with 50 mM Na ), in red for sample C (with $50 \mathrm{mM} \mathrm{K}^{+}$), and in purple for sample D (with $50 \mathrm{mM} \mathrm{Rb}{ }^{+}$).

Supplementary Figure $6 \mid$ Comparison of 2D NCA spectra for NaK under different ionic conditions. The spectra show NaK at low ionic ( $<1 \mu \mathrm{M}$ ) conditions (grey contours), and in the presence of $50 \mathrm{mM} \mathrm{Na}^{+}$(blue), $150 \mathrm{mM} \mathrm{Na}^{+}$(cyan), $50 \mathrm{mM} \mathrm{Rb}^{+}$(purple), $50 \mathrm{mM} \mathrm{K}{ }^{+}$ (red), and $150 \mathrm{mM} \mathrm{K}^{+}$(magenta).

Supplementary Figure $7 \mid$ Comparison of ${ }^{15} \mathrm{~N}-{ }^{15} \mathrm{~N}$ PDSD spectrum and NHHN spectrum. The ${ }^{15} \mathrm{~N}-{ }^{15} \mathrm{~N}$ PDSD spectrum shows a clear T62'-T63' cross-peak, whilst the NHHN spectrum does not. The spectra were recorded on a 16.4 T wide-bore NMR spectrometer at 11 kHz MAS rate.

Supplementary Figure $8 \mid 2 D^{15} \mathrm{~N}-{ }^{13} \mathrm{CA}$ correlation spectrum of uniformly $\left[{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}\right]$ labeled NaK2K in the presence of $\mathbf{5 0} \mathbf{~ m M ~ K}{ }^{+}$. The spectrum shows a single set of peaks for the SF (assignment indicated; T62' is not confirmed by sequential assignment). The spectrum was recorded on a 16.4 T wide-bore NMR spectrometer at 17 kHz MAS rate.

Supplementary Figure 9 | Ion occupancy along the SF axis during simulations. Ion occupancy during (a) $\mathrm{K}^{+}$outward and (b) $\mathrm{K}^{+}$inward, as well as (c) $\mathrm{Na}^{+}$outward and (d) $\mathrm{Na}^{+}$ inward simulations. Details of outward and inward $\mathrm{K}^{+}$simulations are listed as simulation I in Supplementary Table 1, while outward and inward $\mathrm{Na}^{+}$simulations are listed as simulation V in Supplementary Table 1.
a

b

Supplementary Figure $\mathbf{1 0}$ | Comparison of potential of mean force of sodium permeation simulations. (a) $\mathrm{Na}^{+}$simulations with a mixture of flipped and crystal conformations in different subunits (simulation V, Supplementary Table 1). (b) $\mathrm{Na}^{+}$simulations with the crystal conformation in all subunits (simulation III, Supplementary Table 1). Here $\mathrm{Na}^{+}$was tightly bound to the SF with little ion movement due to high free energy barriers > $8 \mathrm{kcal} / \mathrm{mol}$. The reaction coordinate d12 corresponds to the distance between the $\mathrm{Na}^{+}$in the SF and the $\mathrm{Na}^{+}$at the side entrance, and z1 corresponds to the position of the $\mathrm{Na}^{+}$in the SF relative to the lowest position of T63.

$\mathrm{K}^{+} / \mathrm{Na}^{+}($compartment $a)>\mathrm{K}^{+} / \mathrm{Na}^{+}($compartment $b)$

Supplementary Figure 11 | The system used in the computational electrophysiology simulations, consisting of two membrane layers (lipids in yellow). Each layer includes one NaK channel (gray cartoon: PDB ID: 3E83), surrounded by water, $\mathrm{K}^{+}$ions (red balls) and $\mathrm{Cl}^{-}$ ions (cyan balls). Periodic boundary conditions create two compartments ( $a$ and $b$ ) with two more $\mathrm{K}^{+} / \mathrm{Na}^{+}$ions in $a$ than in $b$. Thus, a positive transmembrane voltage gradient is established across the upper channel, while a negative voltage gradient is established across the lower channel.

Supplementary Figure $\mathbf{1 2} \mid$ Snapshots of the NaK simulations. (a) Outward $\mathrm{K}^{+}$conduction (simulation I, Supplementary Table 1), (b) inward $\mathrm{K}^{+}$conduction (simulation I, Supplementary Table 1), (c) outward $\mathrm{Na}^{+}$conduction (simulation V, Supplementary Table 1), and (d) inward $\mathrm{Na}^{+}$conduction (simulation V, Supplementary Table 1) reveal differences in the hydration states of $\mathrm{K}^{+}$and $\mathrm{Na}^{+}$ions in the SF during permeation.

Supplementary Figure $13 \mid$ The structure of the SF from KcsA in low and high concentration $\mathrm{K}^{+}$buffers, known as the collapsed and conductive SF, respectively.
